[AGI House] Resource Packet - Proactive Agent Build Day (April 26th)

AGI House × **Even Realities Info**

Event Homepage: Proactive Agent Build Day

Find team building info and general event question channels on the event page

👋 Introduction

The next frontier in AI isn't a better model. It's an agent that's already with you — one that notices, remembers, and acts before you think to ask.

On April 26, AGI House and Even Realities are bringing together the sharpest builders, researchers, and engineers in AI for a full day of thinking and building around autonomous agents. The day is anchored by a simple but underexplored constraint: what does agent design look like when the interface is always on?

Every attendee will get hands-on time with the Even Realities G2, a new generation of AI glasses built for the age of ambient computing. This is a rare opportunity to build against real wearable hardware on day one, with the people who made it in the room.

What you'll work on

Three tracks, designed to push from theory to prototype in a single day:
✦ Ambient Agents — Your agent notices before you ask. Build proactive, context-aware systems that act without a trigger.
✦ Agents with Memory — Your agent remembers what matters. Build systems with persistent context, long-horizon recall, and memory infrastructure that learns across sessions.
✦ Agents for Good — Your agent makes the world more accessible. Wellbeing, accessibility, and real human impact through always-on presence.

For the winner of each track:
🏆 $1,000
👓 1 pair of G2 glasses for each team member

Event Schedule — Sunday 4/26:

- 10:00 AM – Doors open & networking
- 11:00 AM – Opening keynote & framing
- 12:00 PM – Track overviews & team formation
- 12:15–8:00 PM – Lunch, dinner & building
- 3:00 PM – Submission instructions posted
- 5:00 PM – Mid-session check-ins
- 6:00 PM – Dinner
- 7:00–8:30 PM – Demos & discussion
- ~8:30 PM – Winners announced

🏆 Tracks & Prizes

Theme: Proactive Agents - agents that notice, remember, and act before you ask.

✨ Track 1: Ambient Agents
Your agent notices before you ask. Build proactive, context-aware systems that act without a trigger.

✨ Track 2: Agents with Memory
Your agent remembers what matters. Build systems with persistent context, long-horizon recall, and memory infrastructure that learns across sessions.

✨ Track 3: Agents for Good
Your agent makes the world more accessible. Wellbeing, accessibility, and real human impact through always-on presence.

✨Best Even G2 Integration

Prize pool - $4,000 cash + Even G2 hardware

Prize	Cash	Hardware
Track 1 — Ambient Agents winner	$1,000	G2 pairs for team

Track 2 — Agents with Memory winner	$1,000	G2 pairs for team
Track 3 — Agents for Good winner	$1,000	G2 pairs for team
Best Even G2 Integration (cross-track)	$1,000	G2 pairs for team

Note on Even G2 prize fulfillment: Winning teams coordinate with Even Realities post-event to send in their prescription details. Even G2 pairs ship directly — not handed out on-site.

We're located at 1868 Floribunda Ave., Hillsborough, CA. Due to limited parking, we encourage using Uber/Lyft or carpooling (see below).

🅿️ Parking Instructions

If driving, please consider parking in the downtown Burlingame and Ubering/walking over.

If parking near the house, please make sure to park on the golf course side of the Eucalyptus street, as indicated by the green area on the map below. DO NOT park on the house side, the walkway, or on Floribunda Avenue. Any parking violations could jeopardize the operation of the event and may also result in your car being towed.

🛜 Wifi

Name: LatentSpace

Password: attentionisallyouneed

📔House Rules

AGI House is an active co-living and co-working space.

- Please refrain from entering private bedrooms or going upstairs.
- Handle our door knobs gently to avoid unintended escape room scenarios.
- Don’t forget to flush the restrooms and clean the toilet seats.
- Avoid congregating on Floribunda Ave and obstructing traffic. We've had complaints from neighbors before.

Tracks Footnote

We're aware that there may be discrepancies in the amount of resources that different teams may enter the competition with, be it personal GPU access, prior Even G2 SDK familiarity, or personal hardware, which gives an advantage in building. Thus, we ask that you state very clearly what you worked on, and what personal resources you had access to for the duration of this hackathon. You're encouraged to pursue whatever you feel is most enriching to you and will ensure that all tracks are competitive regardless of personal resources.

All three tracks are equally weighted in judging. You are welcome to pursue whatever project brings you the most joy.

Thank you and happy hacking!

Track 1 - Ambient Agents

Summary

Design agents that notice before the user asks. This track focuses on proactive presence - systems that sense context (location, calendar, conversation...) and surface the right action, information, or nudge at the right moment. The emphasis is on judgment under ambiguity: knowing when to speak, when to stay silent, and when to act on the user's behalf.

The Even G2 form factor - always-on, glanceable, hands-free - makes ambient agents a natural fit. Builds should feel invisible until they matter.

What You Might Build

Though this track is open-ended, here is general scaffolding (not requirements):

- A calendar-aware agent that preps you before meetings (names, context, last talking points)
- Context triggers that turn ambient sensing into discrete agent actions
- A notification filter that silences noise and surfaces only signal
- A "walk-and-think" agent that captures and organizes spoken thoughts
- Location- or time-based skill routing

- A silent co-pilot that surfaces info on the HUD only when relevant

You are encouraged to:

- Define clear trigger conditions (when does the agent speak up?)
- Design for glanceability - the HUD is 576×288 monochrome
- Respect attention - interruption is expensive
- Demonstrate end-to-end flow on G2, not just a phone mock

Judging Criteria

Equal weighting across:

- Technical complexity - how well does it handle real ambient signals?
- Execution quality - stability, responsiveness, HUD design
- Leverage of Even G2 form factor - does this need to be on the face?

We are looking for agents that are felt, not just demonstrated.

Track 2 - Agents with Memory

Summary

Build agents whose value compounds over time. This track centers on persistent context, long-horizon recall, and memory infrastructure - systems that don't forget, and whose understanding of the user, project, or domain sharpens across sessions.

Memory is a hot frontier in agent research right now. Builds in this track should go beyond "append to a log" — we're looking for architecture: what gets stored, how it's retrieved, how it's summarized, and how it learns.

What You Might Build

- A personal knowledge layer that grows from ambient capture on Even G2
- Vector / graph / hybrid memory stores with smart retrieval policies
- Summarization pipelines that keep long-horizon context useful
- Memory-aware agents that recognize recurring people, places, and topics
- Forgetting mechanisms - deciding what not to keep

- Memory sharing across agents (one user, many agents)
- Tooling for inspecting, editing, or exporting agent memory

You are encouraged to:

- Define clear memory interfaces (read/write/query/forget)
- Demonstrate recall quality across sessions, not within one
- Respect privacy - memory on a wearable is especially sensitive
- Show real improvement over a memoryless baseline

Judging Criteria

Equal weighting across:

- Technical rigor of the memory architecture
- Demonstrable long-horizon improvement (not just one-shot)
- Leverage of Even G2 form factor - what does memory look like on always-on hardware?

We value thoughtful architecture over polished demos with hidden state.

Track 3 - Agents for Good

Summary

Build agents that make the world more accessible. This track focuses on wellbeing, accessibility, and real human impact - leveraging always-on, hands-free presence to help people who are underserved by screen-based computing.

The Even G2 is uniquely suited to this space: it's on your face, not in your pocket, and can surface information or assistance continuously without demanding attention.

What You Might Build

- Real-time captioning / translation for the hard of hearing
- Visual assistance for low-vision users (scene description, reading aid)
- Cognitive scaffolding for ADHD, memory loss, or task overload
- Social cue support for neurodivergent users
- Mental health check-ins and ambient regulation

- Navigation aids for mobility-impaired users
- Eldercare companions with memory and routine support

You are encouraged to:

- Ground the build in a real user need (talk to someone who would use it)
- Design for dignity - assistive tech should not feel clinical
- Demonstrate end-to-end flow on G2
- Show that the wearable form factor unlocks something a phone cannot

Judging Criteria

Equal weighting across:

- Real-world usefulness + impact — who does this help, and how much?
- Execution quality — does it actually work for the intended user?
- Leverage of Even G2 form factor — ambient, hands-free, always-on

Projects should feel deployable, not demonstrative.

Even Realities & Developer Experience

Even Realities is a Shenzhen-based technology company building AI-powered smart glasses. Its flagship product, Even G2, is designed around a simple belief: the best technology doesn't demand your attention - it earns it. Even's approach to AI is human-first and privacy-first, built for the world as it is today, not the one being promised for tomorrow.

Even Realities builds upon an open SDK. Every team will receive an Even G2 loaner pair at build start.

To get access:

- Pick up your team's Even G2 pair at the hardware desk on event day
- SDK docs + fast-start kit shared below

What Even G2 does not do (yet):

- No camera — design for audio + HUD only
- No color display
- Limited on-device compute — heavy lifting happens on the paired phone

A 10-minute overview so you can start shipping to the G2 on day one.

Architecture in One Picture

- Phone (app) is the brain. Your app logic runs here — network calls, LLM calls, state, storage.
- Even G2 is the HUD surface. Monochrome green, 576×288, always-on, no camera.
- Tri-Sync keeps all three in lockstep over BLE. You target one SDK surface; the app handles the rest.

Mental model: build a small, glanceable app on the phone, and let the HUD surface the 1–2 things that matter in the moment.

Dev Setup - 5 Steps

1. Install Even Realities on your phone (iOS / Android)
2. Pair your G2 (Settings → Devices → Add → follow prompts)
3. Log into your account inside Even Hub https://hub.evenrealities.com (top-right profile → "Dev Portal Login"). This unlocks Dev Mode on the phone.
4. Dev Mode = Enabled on the phone. You'll now see your private channel apps on-device & have the local testing pipeline available after an app restart.
5. Clone the quick-start kit from git — HUD + mic + R1 boilerplate, ready to build on. https://github.com/even-realities/everything-evenhub

Once Dev Mode is on, any .ehpk you upload to your Private channel on the Dev Portal appears on your app within seconds.

The Build Loop

Local dev mode

> write code —▶ build —▶ scan QR of (localhost) —▶ test —▶ iterate

Testing on glasses

> write code —▶ package .ehpk —▶ upload to Private —▶ test —▶ iterate

- Release channels: Private (just you) → Beta (invite list) → Public (Hub store). Stay in Private for the hackathon unless you want beta testers.
- Fix-forward versioning - no rollbacks. Ship a new version, don't patch a bad one.

Simulator Access

If you want a faster loop, the G2 simulator runs on desktop and renders the HUD locally.

Simulator info & commands: https://hub.evenrealities.com/docs/

What to Focus On (Builder TL;DR)

- Phone does the work, glasses show the answer. Don't try to run heavy logic on the glasses.
- Design for glance, not gaze. Most users see the HUD for <2 seconds at a time.
- No camera. Build around audio, context, and state — not vision.

Demoing Your Build

G2's HUD lives on your face - which makes it magical in person, but awkward to demo to a room. A few ways to handle it:

- Simulator for the live demo. The G2 simulator mirrors the HUD on your laptop screen in real time. Run your app through it during the demo so judges and the audience see exactly what you see. This is the primary demo path.

- Slides/deck for the story. A short deck (problem → what the agent notices → HUD mock → flow) frames the build before you run it. Screenshots from the simulator drop straight into slides.
- Pass the glasses around, but don't rely on it. Letting judges try the G2 is powerful, but slow and doesn't scale to an audience. Treat it as a bonus, not the demo itself.

Why the workaround: the HUD is a personal, monochrome waveguide display - it can't be projected or screen-shared the way a phone screen can. Simulator + deck is how you tell the story at scale.

Want Other Teams to Try Your Build?

If your app is far enough along that you want feedback from other hackers, promote it from Private to Beta in the Dev Portal:

- Go to hub.evenrealities.com → Dev Portal → your app.
- On your latest version, click Promote → Beta.
- Add testers by email (the Even Realities account email they signed up with). They'll see your app in their Hub within seconds, no re-pair needed.
- Swap emails with another team — mutual beta = instant feedback loop.

//if you only have one build, then you will have to resort to inviting yourself to the beta testing as well;

Stay in Beta for the duration of the event. Don't ship to Public (store) during the hackathon.

Support

- On-site: Devs would be on-site and online all day.
- Docs: https://hub.evenrealities.com/docs/

Build something that couldn't exist on a phone. That's the whole point.

Project Submission Info

To submit projects, simply press ‘create project’ on the event page. Make sure to tag all teammates, and have all teammates fill out the submission questions. Please include your full tech stack, and make sure to select the track you’re competing on.
